

# Developing in Power BI

**with Streaming Datasets and Real-time Dashboards**

# Agenda

- Introduction to Real-time Datasets
  - Creating a Streaming Dataset with the API
  - Designing Dashboards with Streaming Data Tiles
  - Creating a Push Dataset with Real-time Data
  - Integrating Azure Streaming Analytics Jobs

# Pull Datasets versus Real-time Datasets

- Pull Datasets
  - Imported Datasets
  - DirectQuery Datasets
  - Live Connect Datasets
- Real-time Datasets
  - Streaming Datasets
  - Push Datasets
  - Hybrid Datasets

# Streaming Datasets

- Data stored in cloud-based cache – not persisted in DB
- Restricted to single table - no rich data modeling
- Not supported by standard Power BI report designer
- Dashboard created using specialized streaming data tiles
- No support for DAX, aggregation or filtering

# Push Datasets

- Data stored in Azure SQL DB – not in cache
- Supports multiple tables and table relationships
- Supported by standard Power BI report designer
- Supports DAX, measures, aggregation & filtering

# Hybrid Datasets

- Data stored in cloud-based cache **AND** in Azure SQL DB
- Restricted to single table and no rich data modeling
- Supported by streaming data tiles
- Supported by Power BI report designer

**DEMO**

## **Creating a Hybrid Dataset by Hand**

# Agenda

- ✓ Introduction to Real-time Datasets
- Creating a Streaming Dataset with the API
  - Designing Dashboards with Streaming Data Tiles
  - Creating a Push Dataset with Real-time Data
  - Integrating Azure Streaming Analytics Jobs

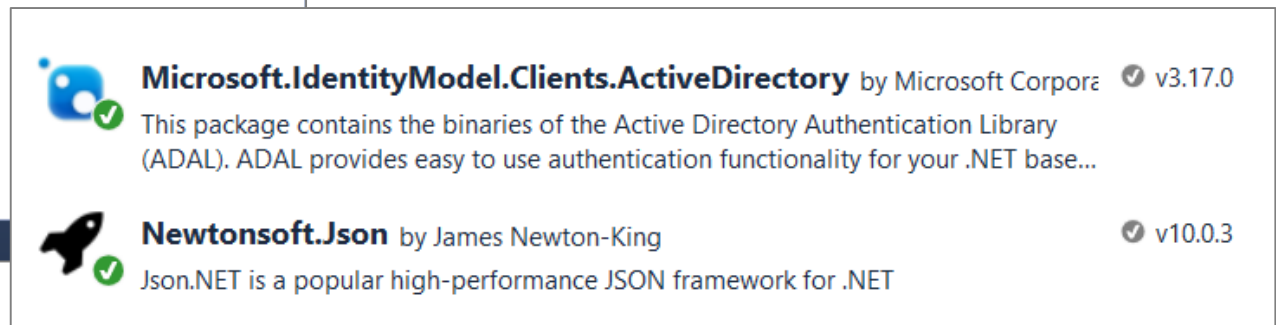

# Real-time Scenario Being Simulated

- Heisenberg labs processes chemicals
  - Required to monitor temperatures during processing
  - Temperature must be monitored on per-second basis
  - Send alerts if temperature exceeds preset threshold

# The StreamingDatasetsDemo Project

- Console application project in Visual Studio 2017
  - Installed package for Azure AD Authentication library
  - Installed package to serialize .NET objects to JSON

# Executing Power BI Service API Calls

- Generic helper methods designed to execute HTTP operations

```
private void ExecutePostRequest(string restUri, string postBody) {  
    1 // prepare REST call  
    HttpContent body = new StringContent(postBody);  
    body.Headers.ContentType = new MediaTypeWithQualityHeaderValue("application/json");  
    HttpClient client = new HttpClient();  
    client.DefaultRequestHeaders.Add("Accept", "application/json");  
    client.DefaultRequestHeaders.Add("Authorization", "Bearer " + AccessToken);  
    2 // execute REST call  
    HttpResponseMessage response = client.PostAsync(restUri, body).Result;  
}
```

# Creating a Streaming Dataset

- Streaming dataset created using JSON schema definition
  - Streaming dataset limited to a single table
  - Columns defined using name and datatype
  - No support for any other column properties (e.g. formatting)

```
DemoStreamingDataset.json  X
{
  "name": "TemperatureReadings",
  "defaultMode": "Streaming",
  "tables": [
    { "name": "TemperatureReadings",
      "columns": [
        { "name": "Run", "dataType": "string" },
        { "name": "Time", "dataType": "Datetime" },
        { "name": "TimeWindow", "dataType": "string" },
        { "name": "TargetTemperature", "dataType": "Double" },
        { "name": "MinTemperature", "dataType": "Double" },
        { "name": "MaxTemperature", "dataType": "Double" },
        { "name": "BatchA", "dataType": "Double" },
        { "name": "BatchB", "dataType": "Double" },
        { "name": "BatchC", "dataType": "Double" }
      ]
    }
  ]
}
```

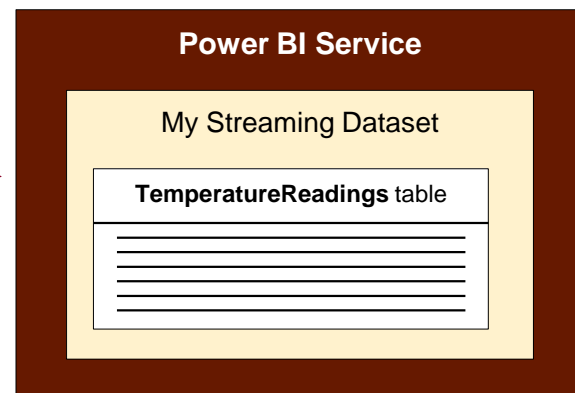

# Creating a Custom Dataset

- Dataset created by executing HTTP POST operation
  - One-time operation done as application begins running

```
1 // prepare call to create new dataset
2 string restUrlDatasets = ProgramGlobalConstants.PowerBiServiceRootUrl + "datasets";
3 string jsonNewDataset = Properties.Resources.NewDataset_json;
// execute REST call to create new dataset
string json = ExecutePostRequest(restUrlDatasets, jsonNewDataset);
// retrieve Guid to track dataset ID
Dataset dataset = JsonConvert.DeserializeObject<Dataset>(json);
CustomDatasetId = dataset.id;
```

```
DemoStreamingDataset.json
{
  "name": "TemperatureReadings",
  "defaultMode": "Streaming",
  "tables": [
    {
      "name": "TemperatureReadings",
      "columns": [
        { "name": "Run", "dataType": "string" },
        { "name": "Time", "dataType": "Datetime" },
        { "name": "TimeWindow", "dataType": "string" },
        { "name": "TargetTemperature", "dataType": "Double" },
        { "name": "MinTemperature", "dataType": "Double" },
        { "name": "MaxTemperature", "dataType": "Double" },
        { "name": "BatchA", "dataType": "Double" },
        { "name": "BatchB", "dataType": "Double" },
        { "name": "BatchC", "dataType": "Double" }
      ]
    }
  ]
}
```

# Adding Rows by Converting C# to JSON

```
TemperatureReadingsRow row = new TemperatureReadingsRow {
    Run = RunName,
    Time = DateTime.Now,
    TimeWindow = currentTimeWindow,
    TargetTemperature = 212,
    MinTemperature = 100,
    MaxTemperature = 250,
    BatchA = temperatureBatchA,
    BatchB = temperatureBatchB,
    BatchC = temperatureBatchC,
};

TemperatureReadingsRow[] rows = { row };
TemperatureReadingsRows temperatureReadingsRows = new TemperatureReadingsRows { rows = rows };
string jsonNewRows = JsonConvert.SerializeObject(temperatureReadingsRows);
string restUrlTargetTableRows = string.Format("{0}/{1}/tables/TemperatureReadings/rows", restUrlDatasets, DatasetId);
string jsonResultAddExpenseRows = ExecutePostRequest(restUrlTargetTableRows, jsonNewRows);
```

```
public class TemperatureReadingsRow {
    public string Run { get; set; }
    public DateTime Time { get; set; }
    public string TimeWindow { get; set; }
    public double TargetTemperature { get; set; }
    public double MinTemperature { get; set; }
    public double MaxTemperature { get; set; }
    public double BatchA { get; set; }
    public double BatchB { get; set; }
    public double BatchC { get; set; }
}

class TemperatureReadingsRows {
    public TemperatureReadingsRow[] rows { get; set; }
}
```

```
{
  "rows": [
    {
      "Run": "Run 06",
      "Time": "2017-10-05T22:43:40.364569-04:00",
      "TimeWindow": "22:43:30",
      "TargetTemperature": 212.0,
      "MinTemperature": 100.0,
      "MaxTemperature": 250.0,
      "BatchA": 152.73999999999995,
      "BatchB": 152.78,
      "BatchC": 152.25
    }
  ]
}
```

**DEMO**

# **Creating a Streaming Dataset using the Power BI Service API**

# Agenda

- ✓ Introduction to Real-time Datasets
- ✓ Creating a Streaming Dataset with the API
- Designing Dashboards with Streaming Data Tiles
  - Creating a Push Dataset with Real-time Data
  - Integrating Azure Streaming Analytics Jobs

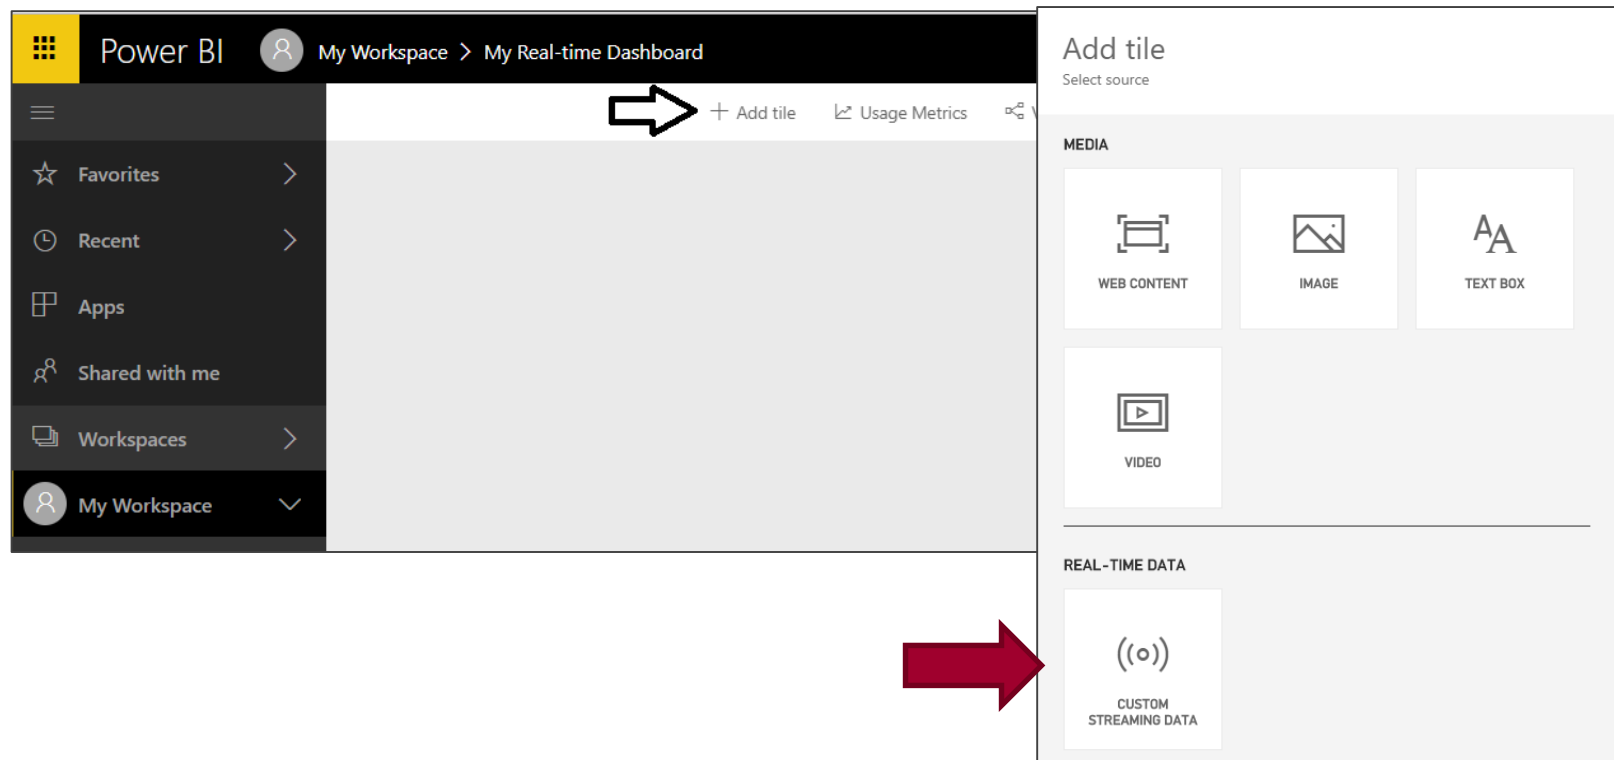

# Streaming Data Tiles

- Streaming Data surfaced using Streaming Data Tiles
  - Used to surface data values from streaming dataset cache
  - Optimized to provide smooth animations for real-time data
- Available set of streaming titles as of today
  - Card
  - Gauge
  - Line chart
  - Cluster Bar Chart
  - Cluster Column Chart

# Creating Dashboards with Streaming Datasets

- You cannot use the Power BI report designer
  - Instead, you add real-time data tiles directly to a dashboard
  - Real-time data tiles different from standard set of Power BI visuals

# Creating a New Streaming Data Tile

- When creating a streaming data tile...
  - Select dataset that is a streaming dataset or a hybrid dataset
  - Choose the type of data streaming tile

Add a custom streaming data tile

Choose a streaming dataset

[+ Add streaming dataset](#)

# Agenda

- ✓ Introduction to Real-time Datasets
- ✓ Creating a Streaming Dataset with the API
- ✓ Designing Dashboards with Streaming Data Tiles
- Creating a Push Dataset with Real-time Data
  - Integrating Azure Streaming Analytics Jobs

# Real-time Scenario Being Simulated

- Contribution website accepts contributions from donors
  - Website calls web service to process credit card transaction
  - Website calls to Power BI REST API to create & update dataset

# Creating a Push Dataset

- Push dataset created using JSON schema definition
  - Push dataset can contain multiple tables and table relationships
  - Tables can contains measures as well as columns
  - Columns & measures can be defined with formatString & dataCategory

```
{
  "name": "@DatasetName",
  "defaultMode": "Push",
  "tables": [
    {
      "name": "Contributions",
      "columns": [
        { "name": "ContributionID", "dataType": "Int64" },
        { "name": "Contributor", "dataType": "string" },
        { "name": "State", "dataType": "string", "dataCategory": "StateOrProvince" },
        { "name": "City", "dataType": "string", "dataCategory": "Place" },
        { "name": "Zipcode", "dataType": "Int64", "dataCategory": "PostalCode" },
        { "name": "Gender", "dataType": "string" },
        { "name": "Time", "dataType": "Datetime", "formatString": "hh:mm:ss" },
        { "name": "TimeWindow", "dataType": "string" },
        { "name": "Amount", "dataType": "Double", "formatString": "$#,##0" }
      ],
      "measures": [
        { "name": "Total Contributions", "expression": "SUM(Contributions[Amount])", "formatString": "$#,##0" },
        { "name": "Contribution Count", "expression": "COUNTROWS(Contributions)", "formatString": "#,##0" },
        { "name": "Max Contribution", "expression": "MAX(Contributions[Amount])", "formatString": "$#,##0" },
        { "name": "Average Contribution", "expression": "AVERAGE(Contributions[Amount])", "formatString": "$#,##0.00" }
      ]
    }
  ]
}
```

# Creating a Tumbling Time Window

# Critical Path Training

<https://www.CriticalPathTrainig.com>

- **PBI365: Power BI Boot Camp – 4 Days**
  - Audience is Business Users, Analysts and Data Professionals
  - Provides hands-on introduction to the Power BI platform
  - Focuses on build solutions using Power BI Desktop
  - Query design, data modeling and report and dashboard design
  - Apps and App Workspaces
- **PBD365: Power BI Developer Boot Camp – 4 Days**
  - Audience is Professional Developers
  - Teaches developing custom visuals with TypeScript and D3
  - Teaches programming with the Power BI APIs
  - Teaches developing with Power BI Embedded
  - Teaches R programming and integrating R with Power BI
  - Teaches how to develop custom connector using M
