

Designing Queries with Power BI Desktop

Agenda

- Deciding What To Measure
- Understanding Queries in Power BI Desktop
- Working with the Query Editor Window
- Designing Advanced Combine Queries
- Importing OLTP Data Into a Star Schema

Data Discovery

- Data can live in a variety of sources
 - Files (e.g. CSV file, Excel workbook)
 - OLTP Databases
 - OLAP Databases
 - SharePoint Lists and Document Libraries
 - Azure-based services
 - Online services & SaaS applications

Deciding What To Measure

- You Must Determine Measurable Objectives
 - Financial (revenue, expenses, profit margin, etc.)
 - Business processes efficiency
 - Customer Satisfaction Levels

Defining Grain Statements

- Grain statements should be defined in initial design phase
 - Grain statements helps determine requirements for BI queries
 - Grain statements can be created & understood by business users
- Example grain statements for BI project at Wingtip Toys
 - What was the total sales revenue over the last 4 years?
 - What was the sales revenue by year, quarter and month?
 - What was the sales revenue by region, state, city and zip code?
 - What was the sales revenue by category, subcategory and product?
 - What was the growth in sales revenue from month to month in 2013?
 - What was profit margin for each product by year, quarter and month?
 - Have their been any products with significantly decreasing profit margin?

Sample OLTP Database: WingtipSalesDB

- Online Transaction Processing (OLTP) System
 - Used for real-time data access and transaction-based data entry
 - Optimized for faster transactions (e.g. inserts, updates & deletes)
 - Tables normalized to reduce/eliminate redundancies
 - Table schemas can be hard for business users to understand

Agenda

- ✓ Deciding What To Measure
- Understanding Queries in Power BI Desktop
 - Working with the Query Editor Window
 - Designing Advanced Combine Queries
 - Importing OLTP Data Into a Star Schema

Getting Around in Power BI Desktop

- What do you need to learn to use Power BI Desktop?
 - Query features for importing data
 - Design features for modeling data
 - Report designer for creating reports
- Navigating between view modes

Query Editor Window

- Power BI Desktop provides separate Query Editor window
 - Provides powerful features for designing queries
 - Displays list of all queries in project on the left
 - Displays **Properties** and **Applied Steps** for selected query on right
 - Preview of table generated by query output shown in the middle
 - Query can be executed using **Apply** or **Close & Apply** command

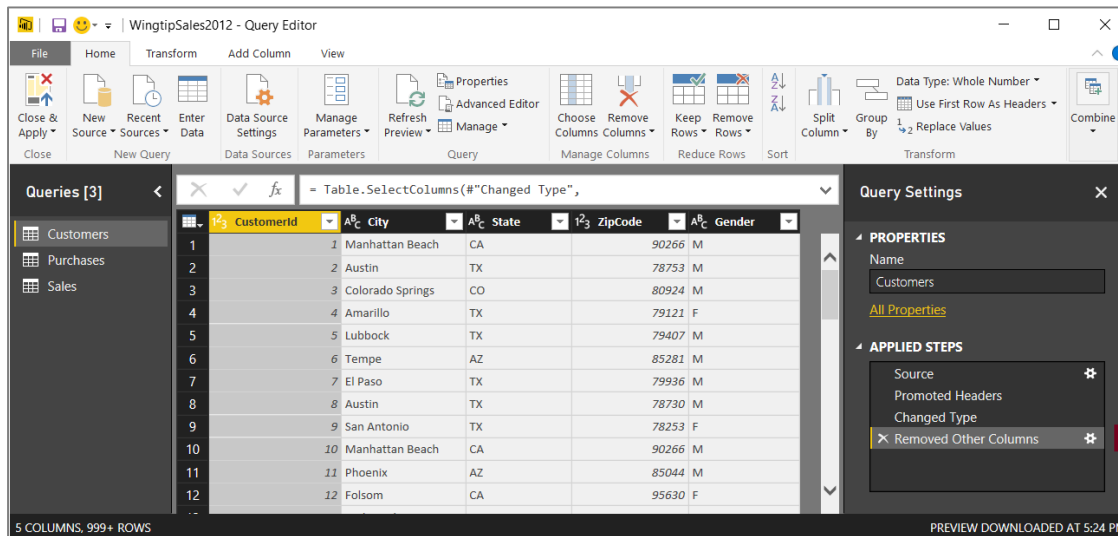

Queries Are Defined as Sequence of Steps

- Here is an example of adding a query step
 - Click a column header then click **Choose Column** button in ribbon

- Query definition is modified by adding new step

Power BI Desktop is an ETL Tool

- ETL process is essential part of any BI Project
 - **Extract** the data from wherever it lives
 - **Transform** the shape of the data for better analysis
 - **Load** the data into dataset for analysis and reporting

Query Steps

- A query is created as a sequence of steps
 - Each step is a parameterized operation on the data
 - Each step has formula which can be viewed/edited in formula bar
 - Query starts with Source step to extract data from a data source
 - Additional steps added to perform transform operations on data
 - You can replay query operations one by one by clicking on steps

The screenshot displays the Power BI Query Editor interface. At the top, the ribbon includes 'File', 'Home', 'Transform', 'Add Column', and 'View'. Below the ribbon, the 'Formula Bar' is active, showing the formula: `= Table.ReplaceValue("#Replaced Female Values","M","Male",Replacer.ReplaceText,`. A red dashed box highlights the formula bar, with a callout box labeled 'step formula bar' pointing to it. On the left, the 'Queries [6]' pane lists 'Customers', 'Sales', 'Purchases', 'Products', 'SalesRegions', and 'SalesRegionsSort'. The main area shows a data table with columns: CustomerId, Customer, State, City, Zipcode, and Gender. The table contains 14 rows of data. On the right, the 'Query Settings' pane is open, showing the 'Properties' section with 'Name' set to 'Customers'. Below it, the 'Applied Steps' section is highlighted with a red dashed box, showing a sequential list of steps: Source, Navigation, Removed Other Columns, Merged Columns, Reordered Columns, Replaced Female Values, Replaced Male Values (selected), Changed Type, and Added Conditional Column. A callout box labeled 'sequential list of steps for query' points to this list.

CustomerId	Customer	State	City	Zipcode	Gender
1	Nina Diaz	CA	Eureka	95501	Female
2	Melinda Carter	CA	Napa	94558	Female
3	Pam Miller	CA	Napa	94558	Female
4	Merle Blackwell	CA	Sacramento	95823	Female
5	Ariel Hale	CA	Sacramento	95818	Male
6	Randy Carter	CA	Sacramento	95818	Male
7	Lillie Hinton	CA	Eureka	95501	Female
8	Ladonna Moody	CA	Napa	94559	Female
9	Buddy McKay	OR	Bend	97701	Male
10	Warren Sykes	CA	Sacramento	95818	Male
11	Jan Rutledge	OR	Portland	97216	Female
12	Dallas Lester	OR	Eugene	97402	Male
13	Matthew Zimmerman	OR	Portland	97220	Male
14	Sheryl Hernandez	CA	Sacramento	95823	Female

Advanced Editor

- Power BI Desktop based on "M" functional language
 - Query in Power BI Desktop saved as set of M statements in code
 - Query Editor generates code in M behind the scenes
 - Advanced users can view & modify query code in Advanced Editor

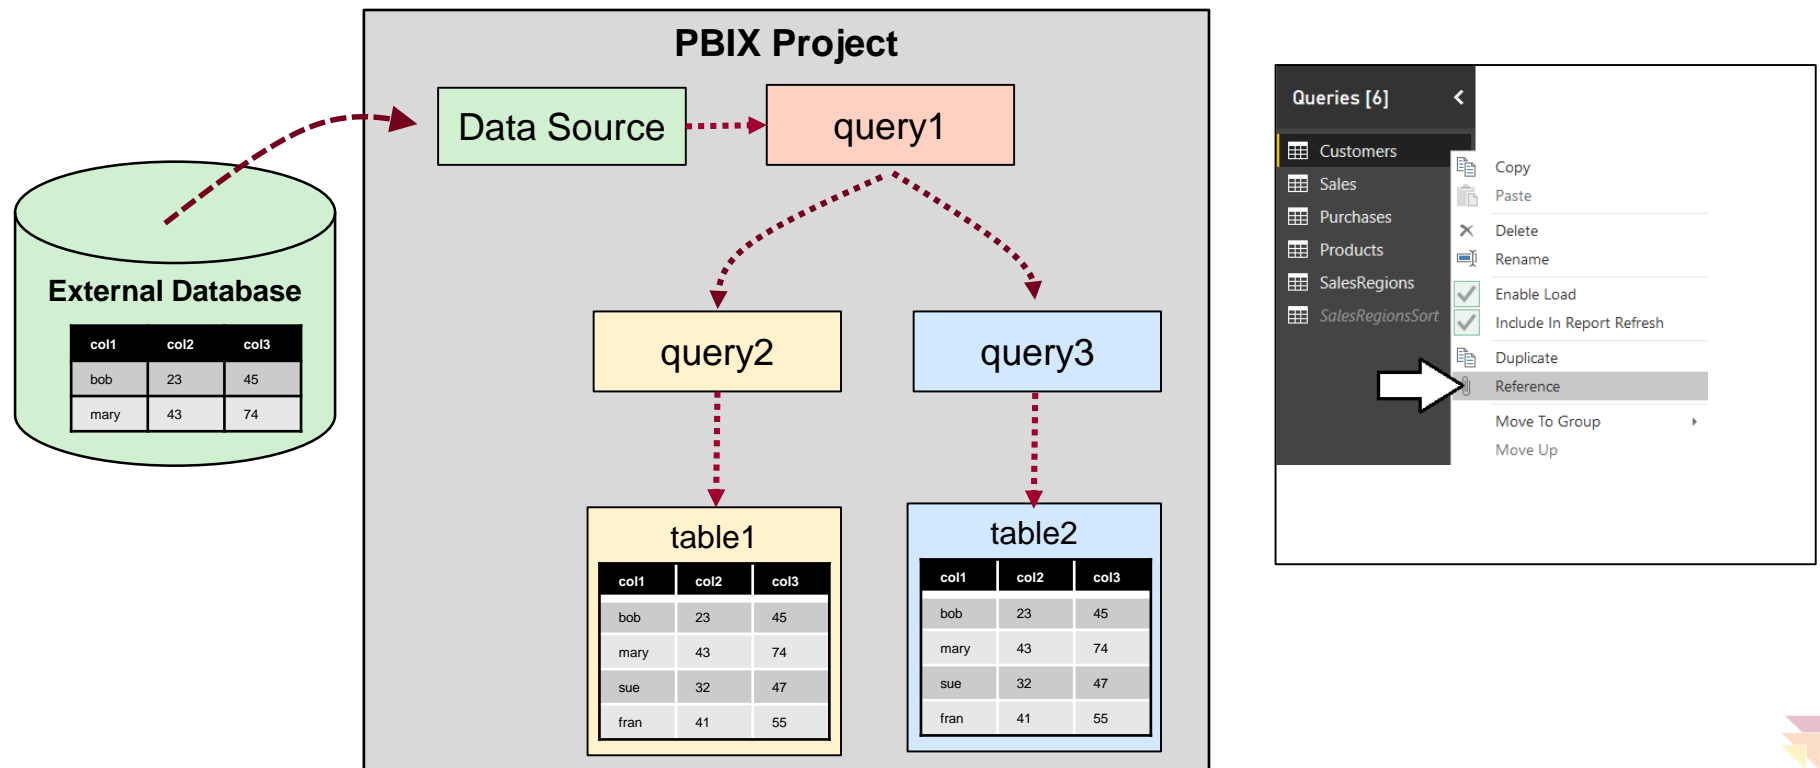

Understanding Query Input and Output

- PBIX project is container for data sources and queries
 - Queries created and saved within scope of Power BI project
 - Queries can pull data from local files
 - Queries can pull data from external content sources
 - Queries main purpose is to load imported data into data model

Query Composition

- Query can serve as source for other queries
 - Allows for creation of reusable base queries & query composition
 - Complexity can be hidden in base queries
 - **Reference** command creates new query based on another query

File-based Data Sources

- Power BI Desktop supports common file types

Supported Databases

- Power BI Desktop supports many database systems

Online Service Data Sources

- Power BI Desktop Supports Online Services
 - Includes popular Software-as-a-Service (SaaS) applications
 - Microsoft is working with 3rd vendors to expand this list

Working with Web Data Sources

- Many public websites publish data using HTML tables
 - Power BI desktop can scrape data from tables in HTML pages

#	NAME	POS.	HT.	WT.	AGE	EXP.	COLLEGE

DEMO

Scraping Data from a Web Page

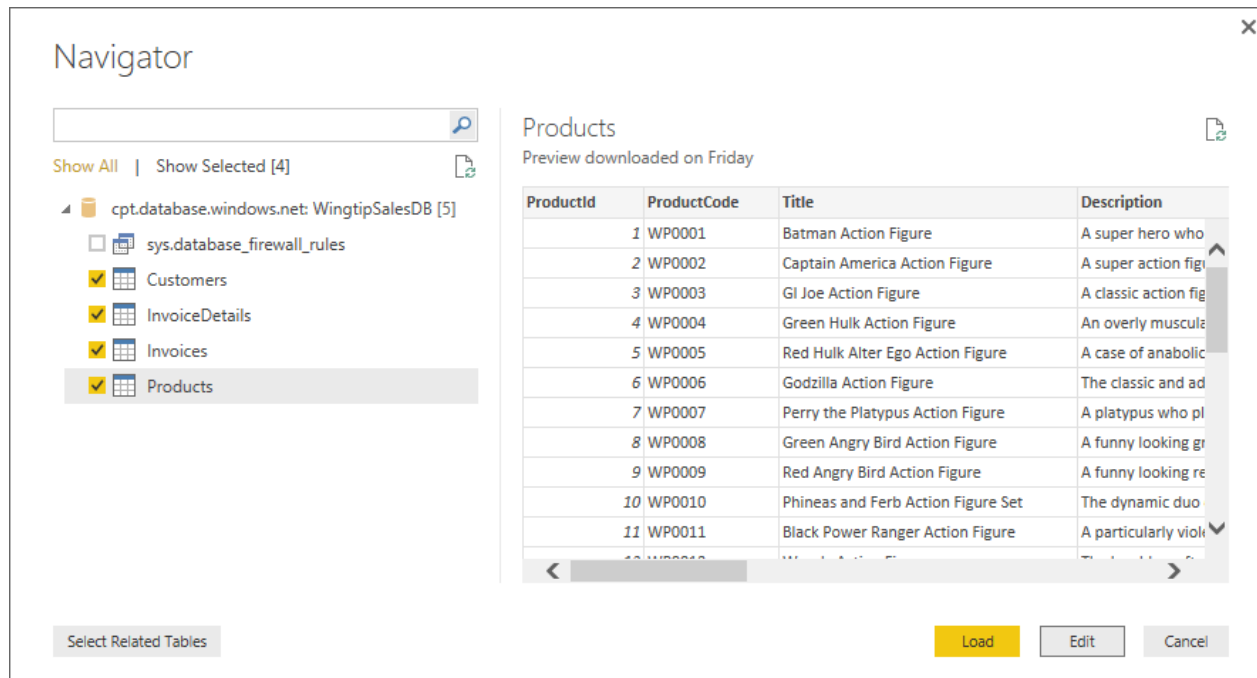

Azure Data Sources

- Power BI Desktop supports many Azure data sources

Selecting Tables from a SQL Database

- Power BI Desktop provides Navigator dialog
 - Allows you to select tables
 - Navigator understands existing table relationships
 - Clicking **Load** will run query and import data
 - Clicking **Edit** will open queries in Query Editor window

DEMO

Creating Queries to Import Data from an Azure SQL Database

Agenda

- ✓ Deciding What To Measure
- ✓ Understanding Queries in Power BI Desktop
- Working with the Query Editor Window
 - Designing Advanced Combine Queries
 - Importing OLTP Data Into a Star Schema

Query Editor Ribbon Tabs

Home tab

Transform tab

Add Column tab

View tab

Examples of Basic Power BI Desktop Steps

- Rename column
- Convert column type
- Format column values
- Reorder columns
- Replace column values
- Expanding related column
- Merging columns
- Splitting columns

Replacing Values

- Used to substitute values during import

Replace Values

Replace one value with another in the selected columns.

Value To Find
M

Replace With
Male

Advanced options

OK Cancel

fx = Table.ReplaceValue("#Replaced

ZipCode	Gender	BirthDate	FirstPurchas
90266	Male	2/24/1966 12:00:00 AM	1/28
78753	Male	2/3/1941 12:00:00 AM	1/28
80924	Male	10/20/1954 12:00:00 AM	1/28
79121	Female	11/4/1974 12:00:00 AM	1/28
79407	Male	8/14/1954 12:00:00 AM	1/28
85281	Male	6/11/1971 12:00:00 AM	1/28
79936	Male	4/25/1974 12:00:00 AM	1/25
78730	Male	10/2/1944 12:00:00 AM	1/25
78253	Female	10/26/1956 12:00:00 AM	1/25
90266	Male	10/2/1955 12:00:00 AM	1/25
85044	Male	1/11/1945 12:00:00 AM	1/25
95630	Female	2/1/1956 12:00:00 AM	1/25

- Removed Other Columns
- Merged Columns
- Reordered Columns
- Replaced Value
- X Replaced Value1

Replace Values

Replace one value with another in the selected columns.

Value To Find
F

Replace With
Female

Advanced options

OK Cancel

Converting Column Types

- Transform data to make it more reliable
 - Convert date-time column to date column
- Transform data to make it more efficient
 - Convert decimal to fixed decimal number for currency

 PurchaseDate		 Quantity		 SalesAmount		 ProductCost	
1/28/2012		1		2.95		1.2	Decimal Number
1/28/2012		6				\$	Fixed Decimal Number
1/28/2012		1		19.95		1 ² / ₃	Whole Number
1/28/2012		5		249.75			Date/Time
1/28/2012		1		2.95			Date

- Beware: Conversion can have destructive effect on data

Expanding Related Columns

- Used to pull data from related tables
 - Saves you from performing SQL joins or VLOOKUP

SalesAmount	Invoices	
119.8	Value	Value
29.95	Value	Value
59.9	Value	Value
399.6	Value	Value
29.9	Value	Value
59.8	Value	Value

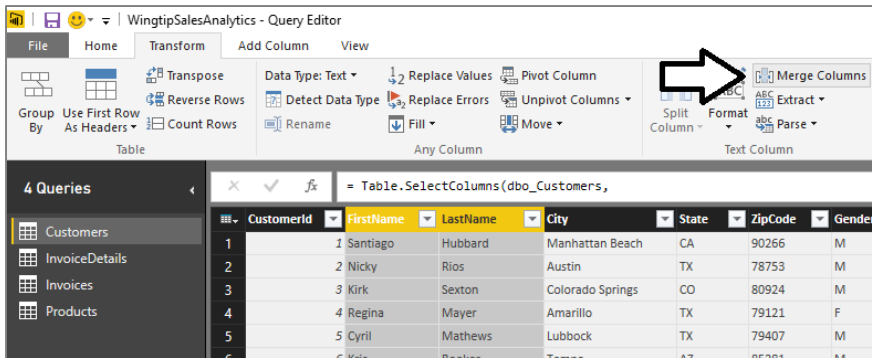

Id	InvoiceId	ProductId	Quantity	SalesAmount	Invoices	Products
1	1	1				Value
2	2	1				Value
3	3	2				Value
4	4	3				Value
5	5	3				Value
6	6	3				Value
7	7	4				Value
8	8	5				Value
9	9	6				Value
10	10	6				Value
11	11	7				Value
12	12	7				Value
13	13	8				Value
14	14	9				Value

Id	InvoiceId	ProductId	Quantity	SalesAmount	InvoiceDate	CustomerId	Products
1	1	1	22	4	119.8	1/28/2012 12:00:00 AM	1 Value
2	2	1	22	1	29.95	1/28/2012 12:00:00 AM	1 Value
3	3	2	22	2	59.9	1/28/2012 12:00:00 AM	2 Value
4	4	3	17	8	399.6	1/28/2012 12:00:00 AM	3 Value
5	5	3	18	2	29.9	1/28/2012 12:00:00 AM	3 Value
6	6	3	18	4	59.8	1/28/2012 12:00:00 AM	3 Value
7	7	4	16	1	2.95	1/28/2012 12:00:00 AM	4 Value

Merging Columns

- Merge two columns into a single column

The screenshot shows the 'WingtipSalesAnalytics - Query Editor' interface. The 'Transform' tab is active, and the 'Merge Columns' button is highlighted with a white arrow. Below the ribbon, a table of customer data is displayed.

	CustomerId	FirstName	LastName	City	State	ZipCode	Gender
1	1	Santiago	Hubbard	Manhattan Beach	CA	90266	M
2	2	Nicky	Rios	Austin	TX	78753	M
3	3	Kirk	Sexton	Colorado Springs	CO	80924	M
4	4	Regina	Mayer	Amarillo	TX	79121	F
5	5	Cyril	Mathews	Lubbock	TX	79407	M
6	6	Kris	Booker	Tampa	AZ	85381	M

Merge Columns

Choose how to merge the selected columns.

Separator

New column name (optional)

	CustomerId	Customer
1	1	Santiago Hubbard
2	2	Nicky Rios
3	3	Kirk Sexton
4	4	Regina Mayer
5	5	Cyril Mathews
6	6	Kris Booker
7	7	Tracy Christensen
8	8	Reed Glover

Splitting Columns

- Split a single column up into two columns

Split Column by Delimiter

Specify the delimiter to split the text column.

Select or enter delimiter

--Custom--

>

Split

☐ At the left-most delimiter

☐ At the right-most delimiter

☒ At each occurrence of the delimiter

Advanced options

OK Cancel

ProductId	Product	Category	Subcategory
1	1 Batman Action Figure	Action Figures	Tough Guys
2	2 Captain America Action Figure	Action Figures	Tough Guys
3	3 GI Joe Action Figure	Action Figures	Tough Guys
4	4 Green Hulk Action Figure	Action Figures	Tough Guys
5	5 Red Hulk Alter Ego Action Figure	Action Figures	Tough Guys
6	6 Godzilla Action Figure	Action Figures	Tough Guys
7	7 Perry the Platypus Action Figure	Action Figures	Cute and Huggable
8	8 Green Angry Bird Action Figure	Action Figures	Cute and Huggable

Adding a Custom Column

- Custom column provide custom logic
 - Logic must be written in M programming language

Add Custom Column

New column name:

Custom column formula:

```
= if [FirstPurchaseDate]=[LastPurchaseDate]  
then "One-time Customer"  
else "Repeat Customer"
```

Available columns:
CustomerId
Customer
State
City
ZipCode
Gender
BirthDate
FirstPurchaseDate
LastPurchaseDate
CustomerType

<< Insert

[Learn about Power BI Desktop formulas](#)

✓ No syntax errors have been detected.

OK Cancel

FirstPurchaseDate	LastPurchaseDate	CustomerType
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/28/2012	1/28/2012	One-time Customer
1/29/2012	11/22/2015	Repeat Customer
1/29/2012	10/2/2015	Repeat Customer
1/29/2012	1/29/2012	One-time Customer
1/29/2012	5/6/2015	Repeat Customer
1/29/2012	1/29/2012	One-time Customer

Adding a Conditional Column

- Abstracts away need to write M code

Add Conditional Column

Add a conditional column that is computed from the other columns or values.

New column name

	Column Name	Operator	Value		Output
If	<input type="text" value="FirstPurchaseDate"/>	<input type="text" value="equals"/>	<input type="text" value="LastPurchaseDate"/>	Then	<input type="text" value="One-time Customer"/>

+ Add Rule

Otherwise

<input type="text" value="Repeat Customer"/>
--

DEMO

Using Queries to Transform Data During the Load Process

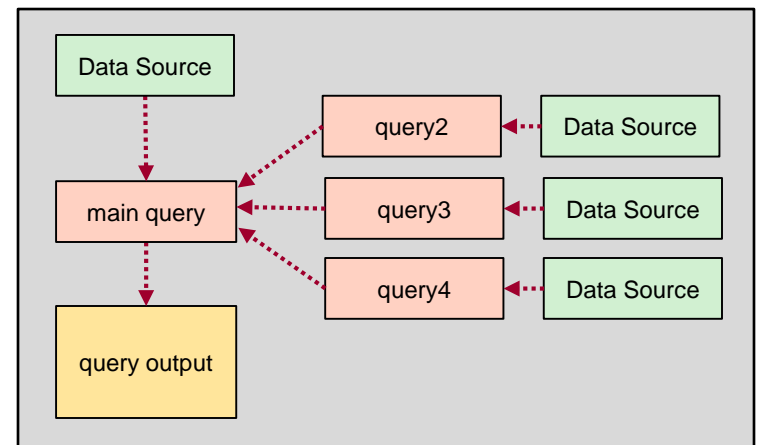

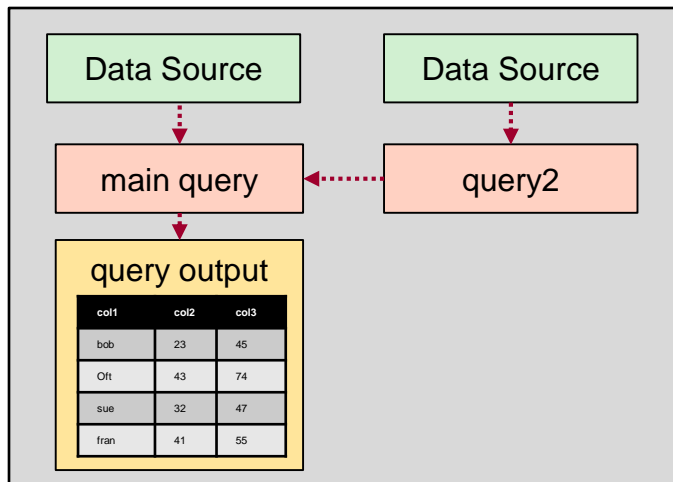

Agenda

- ✓ Deciding What To Measure
- ✓ Understanding Queries in Power BI Desktop
- ✓ Working with the Query Editor Window
- Designing Advanced Combine Queries
 - Importing OLTP Data Into a Star Schema

Combining Queries

- Query can be merged or appended with another query
 - Merge operation allows you combine columns from two tables
 - Append operation allows you to combine rows from two tables
- Two queries are combined into single output for loading
 - Load settings of main query determines where output is loaded
 - Secondary query acts as source for main query
 - Secondary query can be created with connection-only load setting

Merging Columns

Pivoting Columns

- Pivot column adds its values are new columns
 - Create table layout like PivotTable

City	Year	Population
New York, NY	2010	8175133

San Jose, CA	945942	894943	782248

Unpivoting Columns

- Unpivot columns to collapse them into single column
 - Removes PivotTable layout
 - Can be useful to prepare data for charting and analysis

Agenda

- ✓ Deciding What To Measure
- ✓ Understanding Queries in Power BI Desktop
- ✓ Working with the Query Editor Window
- ✓ Designing Advanced Combine Queries
- Importing OLTP Data Into a Star Schema

Data Modeling using a Star Schema

- OLAP Modeling often based on Star Schema
 - Tables defined as fact tables or dimension tables
 - Fact tables related to dimension table using 1-to-many relationships

Designing Queries to Build a Star Schema

- Converts OLTP Data Model to OLAP Data Model
 - Sales table is modeled as a OLAP Fact Table
 - Other tables are modeled as OLAP Dimension tables
 - Requires pulling CustomerId column into Sales table
 - All dimension tables should be directly related to fact table

DEMO

Using Power BI Desktop to Import Data into a Star Schema
